

Linux Restore Prompt for Codex

Upload this PDF to a new Codex chat after Ubuntu is installed and the verified backup drive is connected.

Before you upload

Replace the three placeholders - <BACKUP_ROOT>, <LINUX_DATA_ROOT>, and <LINUX_CODE_ROOT> - with the actual Linux paths. The prompt restores source code from GitHub and private datasets from the external backup; it does not copy credentials or run live market actions.

Ready-to-paste prompt

I am restoring the `custom\_terminal` project onto this Linux machine after a full Windows replacement. Work carefully and preserve the existing research and data contracts.

My verified external backup is mounted at: <BACKUP_ROOT>

Restore project data beneath: <LINUX_DATA_ROOT>

Restore the Git repository beneath: <LINUX_CODE_ROOT>

Your task is to restore a working local development environment only. Do not redesign the project, change strategy or research logic, acquire fresh market data, call Kite/NSE/other market APIs, run a live Kite login, start a backtest, produce a trading recommendation, or delete/overwrite any data without asking me first.

Follow this sequence:

1. Clone `https://github.com/parikshithrg/custom\_terminal.git` into ``<LINUX_CODE_ROOT>/custom_terminal``. Record the checked-out commit and ensure the repository is clean. Read, in this order:

- `docs/project\_status/PROJECT\_MEMORY\_2026\_10\_05.md`
- `docs/linux\_migration.md`
- `docs/linux\_readiness\_report.md`
- `config/data\_snapshot\_manifest.json`

2. Verify the required backup content exists before copying anything:

- 430 `\*\_DAILY.csv` price files;
 - `fno.db` (about 45 GB);
 - `nifty500.csv`;
 - `Data test/data/`;
 - any owner-selected governed/research artifacts that must be retained.
- GitHub does not contain these external datasets. Never substitute a newer, similar, partial, or automatically downloaded dataset.

3. Copy the verified external datasets to ``<LINUX_DATA_ROOT>`` using a resumable, binary-safe method. Do not copy Windows `.venv`, `.pytest\_tmp\*`, Python bytecode, or regenerable caches. Compare the copied data with `config/data\_snapshot\_manifest.json`: price-file count, price inventory hash, industry-map size/hash, and F&O database size/hash must match exactly. Open the F&O database read-only only; do not write, migrate, vacuum, or alter it.

4. Establish the exact project Python baseline, `3.12.14`. If the Linux system Python is different, install an isolated user-local Python 3.12.14 first; do not silently use another minor or patch version. Create `.venv` inside the clone with that exact interpreter, activate it, and install only the pinned project environment:

```
<python-3.12.14> -m venv .venv
source .venv/bin/activate
python -m pip install --upgrade pip
python -m pip install -r requirements.lock
python -m pip install -e .
```

Install ordinary system prerequisites only when needed and explain any administrator-level action before requesting it.

5. Create a non-secret local path file at

``~/config/terminal-builder/data-paths.sh`` with these exports, adjusted to the restored Linux paths:

```
export DTEST_PRICE_DIR="<LINUX_DATA_ROOT>/prices"
export DTEST_FNO_DB="<LINUX_DATA_ROOT>/fno.db"
export DTEST_INDUSTRY_MAP="<LINUX_DATA_ROOT>/nifty500.csv"
export DTEST_ARTIFACTS_DIR="<LINUX_DATA_ROOT>/artifacts"
export DTEST_RUNS_DIR="<LINUX_DATA_ROOT>/runs"
```

This file must contain paths only. Do not add Kite credentials, tokens, API keys, cookies, or other secrets. Source it only for this project.

6. From the clean repository, activate ``.venv``, source the path file, and run:

```
python scripts/validate_environment.py
```

Keep the generated ignored validation record. Report every check, especially Python version, package lock, data hashes, SQLite quick check, Parquet reads, and both test suites. If any check fails, stop before research work and explain the smallest safe correction.

7. If and only if the validator reports ``OPERATIONAL``, show me a concise restore report: checked-out commit, dataset identities, validation result, any non-destructive setup actions performed, and the next pending project milestone. Then wait for my approval before making product, research, or provider changes.

Important boundaries:

- The product is analysis-only and must never place, modify, or cancel trades.
- Current Kite access is transient and must be authenticated again manually; old Windows tokens must not be copied.
- Existing historical artifacts are evidence. Preserve them byte-for-byte.
- Do not claim Linux readiness from a quick/partial validation run.
